The Fabenco G-Series self-closing gate can be installed on all types of handrails – angle, flat bar, and pipe. Installations may vary. Proper installation to a structure that can support the gate is required. Always verify the completed installation for adequate performance.

**Step 1:** Lightly attach the hinge brackets to the vertical upright of the railing with U-bolts (for special applications contact Fabenco, Inc. for compression kits for large diameter, flat bar, and angle iron posts). Additional adjustments may be necessary. Do not tighten the U-bolt nuts at this stage in the installation.

**Step 2:** Slide the gate into position so that the top of the gate matches the top of the railing. Align the hinge bracket to be perpendicular to the gate and opening.

**Step 3:** Loosen the compression brackets and adjust the gate frame to the required opening width. Ensure that the stop plate overlaps and contacts the adjacent upright of the railing, allowing a ¼” maximum clearance. Re-tighten the compression clamps.

**Step 4:** Tighten the hardware on the U-bolts to 20 ft./lbs. of torque.

**ANNUAL INSPECTION PROCEDURE**

- Verify that all fasteners are tightened.
- Replace any missing fasteners.
- Inspect product for any damage. Replace if damage is found.
